

ECO Plus tapered roller bearings with a plastic compound cage

As of September 2016, the ECO Plus tapered roller bearings were converted to a design using a black plastic compound cage.

Affected by this changeover are all ECO Plus axles, ranging from 9 to 12 tonnes. The new bearings with the plastic compound cage have successfully passed all tests and are comparable to the previous bearings using the steel cages.

They are introduced using the existing part numbers and are fully compatible with the previous bearings and a mixed installation is possible.

Note: Tapered roller bearings with plastic compound cages are not a new design for BPW. They were successfully used onwards from the 1990s in Europe.
